UNDERSTANDING SILENT USERS' BEHAVIORS IN LARGE-SCALE ONLINE COMMUNITIES

Roberto Interdonato, Andrea Tagarelli
DIMES Dept., Università della Calabria, Italy

The 23rd Conference on
User Modelling, Adaptation
and Personalization
29th June – 3rd July, 2015

UNIVERSITÀ DELLA CALABRIA

Dipartimento di INGEGNERIA INFORMATICA,
MODELLISTICA, ELETTRONICA E SISTEMISTICA

Lurk(er): what meanings

lurk [lɜːk]
vb (intr)
1. to move stealthily or be concealed, esp for evil purposes
2. to be present in an unobtrusive way; go unnoticed

n
1. (Electronics & Computer Science / Telecommunications) to read messages posted on an electronic network without contributing messages oneself
2. *Austral and NZ slang* a scheme or stratagem for success

[probably frequentative of LOUR; compare Middle Dutch *loeren* to lie in wait]

lurker *n*

Collins English Dictionary – Complete and Unabridged © HarperCollins Publishers 1991, 1994, 1998, 2000, 2003

lurk (lɜrk)

v.i.
1. to lie or wait in concealment, as a person in ambush.
2. to go furtively; slink.
3. to exist unperceived or unsuspected.
4. *Chiefly Computers.* to observe an ongoing discussion without participating in it.

[1250–1300; frequentative of lower²; compare Norwegian *lurka* to sneak away]

lurk'er, *n.*
syn: lurk, skulk, sneak, prowl suggest avoiding observation, often because of a sinister purpose. To lurk is to lie in wait for someone or to move stealthily: *The thief lurked in the shadows.* skulk has a similar sense, but usu. suggests cowardice or fear: *The dog skulked about the house.* sneak emphasizes the attempt to avoid being seen or discovered; it suggests a sinister intent or the desire to avoid punishment: *The children sneaked out the back way.* prowl usu. implies seeking prey or loot; it suggests quiet and watchful roaming: *The cat prowled around in search of mice.*

Thesaurus   Legend: ▌Synonyms ▌Related Words ▌Antonyms

Verb 1. lurk - lie in wait, lie in ambush, behave in a sneaky and secretive manner
▌skulk
conceal, hide - prevent from being seen or discovered; "Muslim women hide their faces"; "hide the money"

2. lurk - be about; "The high school students like to loiter in the Central Square"; "Who is this man that is hanging around the department?"
footle, hang around, lallygag, mess about, mill about, mill around, tarry, loiter, lollygag, lounge, linger, loaf
be - have the quality of being; (copula, used with an adjective or a predicate noun); "John is rich"; "This is not a good answer"
prowl, lurch - loiter about, with no apparent aim

3. lurk - wait in hiding to attack
ambuscade, ambush, bushwhack, lie in wait, scupper, waylay
wait - stay in one place and anticipate or expect something; "I had to wait in line for an hour to get the tickets"
Based on WordNet 3.0, Farlex clipart collection. © 2003-2012 Princeton University, Farlex Inc.

lurk
verb ▌hide, sneak, crouch, prowl, snoop, lie in wait, slink, skulk, conceal yourself, move with stealth, go furtively *He thought he saw someone lurking above the chamber during the address.*

Collins Thesaurus of the English Language – Complete and Unabridged 2nd Edition. 2002 © HarperCollins Publishers 1995, 2002

"Lurker": let's google it …

Outline

1. Lurking in online communities
   a. The issue of controversial definitions
   b. Lurking and online behavioral models
   c. The opportunity of de-lurking

2. Modeling lurking behaviors
   a. Topology-driven lurking definition

3. Lurker ranking methods

4. Experimental evaluation
   a. Static scenarios
   b. Dynamic scenarios

5. Applications to other domains
   a. Vicariously learning
   b. Lurking in social trust contexts

6. Conclusion and future work

LURKING IN ONLINE COMMUNITIES

The 1:9:90 rule of participation inequality (1/3)
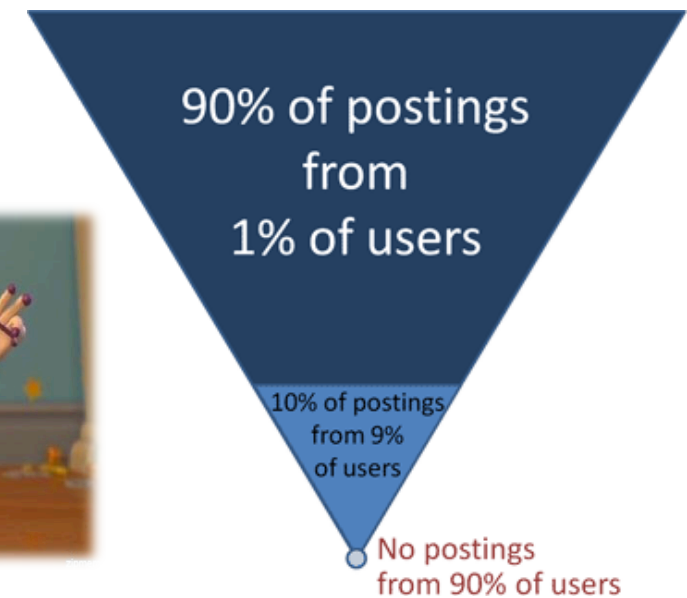

Arthur, C. (2006). What is the 1% rule? In: *The guardian*. UK: Guardian News and Media.

The 1:9:90 rule of participation inequality (2/3)

- [Nonnecke & Preece, 2000] Email-based discussion lists:
  - 77 online health support groups and 21 online technical support groups
  - 46% of the health support group members and 82% of the technical support group members are lurkers
- [Swartz, 2006] On Wikipedia: over 50% of all the edits are done by only 0.7% of the users
- [van Mierlo, 2014] On four DHSNs (AlcoholHelpCenter, DepressionCenter, PanicCenter, and StopSmokingCenter):
  - 63,990 users, 578,349 posts
  - Lurkers account for 1.3% (n=4668), Contributors for 24.0% (n=88,732), and Superusers for 74.7% (n=276,034) of content

Nonnecke, B., Preece, J. (2000). Lurker Demographics: Counting the Silent. In *Proc. SIGCHI Human Factors in Computing*.
Swartz, A. (2006). Raw thought: Who writes Wikipedia. Blog article at www.aaronsw.com/weblog/whowriteswikipedia.
van Mierlo, T. (2014). The 1% rule in four digital health social networks: An observational study. *Medical Internet Research*, 16(2).

The 1:9:90 rule of participation inequality (3/3)

- ## Online learning courses:
  - No relation between interactivity (i.e., posting) and learning (i.e., earned grade)

  - Extend the notion of interactivity to include the lurking activity
    - Each of the 128 students reads at least one contribution
    - 62% of the class are lurkers—only reading posts, not contributing anything

  - No correlation between the no. of readers and the no. of writers
  - Every participant, active or lurking, reads more postings than they write

    $$\frac{R(t)}{p} - \frac{W(t)}{p} \geq 0$$

  - Active participation in an online discussion list, based on passive lurking, is expressed by reading, reflecting on the contribution of all the other members

Ebner, M., Holzinger, A. (2005). Lurking: An underestimated human-computer phenomenon. *IEEE Multimedia*, 12(4), 70–75.

Perception of lurking (1/2)

- Lurkers as "free-riders" [Kollock & Smith,1996; Morris & Ogan, 1996; Wellman & Gulia,1999; Rheingold, 2000]

- Sustainability of an online community
  - Fresh content and timely interactions
  - Lurkers contribute little value [van Mierlo, 2014]

- Lurkers may impair the virality of the community [Nielsen, 2011]

Kollock, P., Smith, M. (1996). Managing the virtual commons. *Computer-mediated communication: Linguistic, social, and cross-cultural perspectives*, 109–128.

Morris, M., Ogan, C. (1996). The internet as mass medium. *Journal of Communication*, 46(1), 39–50.

Wellman, B., Gulia, M. (1999). Net surfers don't ride alone: Virtual communities as communities. *Networks in the Global Village*, 331–366.

Rheingold, H. (2000). *The virtual community: Homesteading on the electronic frontier*. MIT Press.

Nielsen, J. (2011). Participation inequality: Encouraging more users to contribute, http://www.useit.com/alertbox/participation_inequality.html.

Perception of lurking (2/2)

- Most lurkers are NOT free-riders (e.g., [Nonnecke, Preece, & Andrews, 2004; Nonnecke, Andrews, & Preece, 2006])

- Lurking is normal and an active, participative and valuable form of online behavior [Edelmann, 2013]

- Lurkers perceive themselves as community members [Nonnecke et al., 2006]

- Lurking as a form of cognitive apprenticeship: "legitimate peripheral participation" [Lave & Wenger, 1999]

Nonnecke, B., Preece, J., Andrews, D. (2004). What lurkers and posters think of each other. In *Proc. the 37th annual Hawaii Int. Conf. on System Sciences*.

Nonnecke, B., Andrews, D., Preece, J. (2006). Non-public and public online community participation: Needs, attitudes and behavior. *Electronic Commerce Research*, 6(1), 7–20.

Edelmann, N. (2013). Reviewing the definitions of "Lurkers" and some implications for online research. *Cyberpsychology, Behavior, and Social Networking*, 16(9), 645–649.

Lave, J., Wenger, E. (1999). *Legitimate peripheral participation. Learners, learning and assessment*. London: The Open University, pp. 83–89.

How to identify lurkers (1/3)

- Two main features: *seldom posting*, *mostly reading contents*

- Attempts to set quantitative standards:
  - "never post in an online community" [Nonnecke et al., 2006]
  - "post messages only once in a long while" [Golder & Donath, 2004]
  - "no contribution during a 3-month period" [Nonnecke & Preece, 2000]
  - "#posts<4 from the beginning, or never posted in the last 4 months" [Ganley et al., 2012]

- Accounting for the "login" dimension [Chen, 2004]
  - Lurkers log into the community every week throughout a 6-week timespan

Golder, S. A., Donath, J. (2004). Social roles in electronic communities. *Internet Research*, 5, 19–22.
Ganley, D., Moser, C., Groenewegen, P. (2012). Categorizing behavior in online communities: A look into the world of cake bakers. In *Proc. HICSS*, pp. 3457–3466.
Chen, F. C. (2004). Passive forum behaviors (lurking): A community perspective. In *Proc. 6th Int. Conf. on Learning Sciences*, pp. 128–135.

How to identify lurkers (2/3)

- Find a certain percentage of most non-active users as lurkers
  - e.g., [Rau et al., 2008] On Microsoft's Wallop SNS, 40% of the most non-active as lurkers
- Two continuous dimensions (participation pattern) [Leshed, 2005]:
  - *Publicity*: ratio of public (i.e., posting) to non-public (i.e., reading) activities
  - *Intensity*: the frequency of total activities performed by a member
    - Lurkers tend to have higher intensity and lower publicity
- Lurkers may be classified into [Takahashi et al. 2003; Walker et al. 2013]:
  - *Passive* lurkers: only read for their use
  - *Active* lurkers: for propagation, practical use, or personal contact

Rau, P.-L. P., Gao, Q., Ding, Y. (2008). Relationship between the level of intimacy and lurking in online social network services. Computers in Human Behavior, 24(6), 2757–2770.

Leshed, G. (2005). Posters, lurkers, and in between: A multidimensional model of online community participation patterns. In *Proc. HIC*.

Takahashi, M., Fujimoto, M., Yamasaki, N. (2003). The active lurker: Influence of an in-house online community on its outside environment. In *Proc. ACM SIGGROUP Conf. on Supporting Group Work*, pp. 1–10.
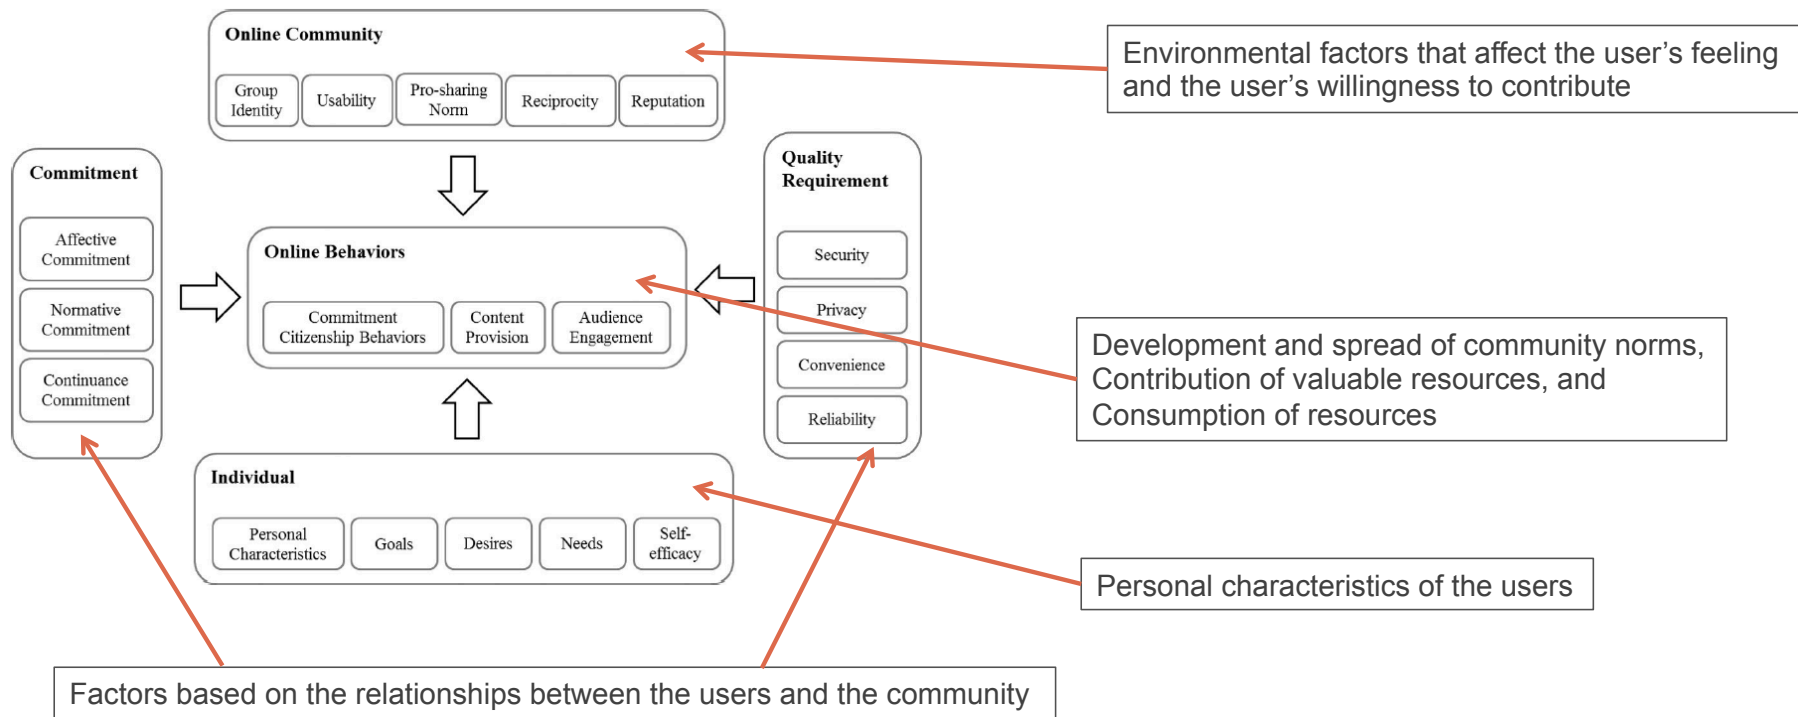

Walker, B., Redmond, J., Lengyel, A. (2013). Are they all the same? Lurkers and posters on the net. *eCULTURE*, 3(1).

How to identify lurkers (3/3)

- Can we generalize using the previously discussed criteria?
  - No, it depends on the size, topics and culture of the online community!
  - Many factors influence online behaviors (e.g., [Bishop, 2007; Fan et al., 2009]):
    - Environmental influences
    - Personal characteristics
    - Organizational commitment

- Many lurkers: good or bad?
  - Active lurkers are beneficial for the propaganda and development of the community
  - but they have low posting rate and lack of valuable content
  - Emergence for strategies to promote *de-lurking*

Bishop, J. (2007). Increasing participation in online communities: A framework for human–computer interaction. *Computers in Human Behavior*, 23(4), 1881–1893.
Fan, Y.-W., Wu, C.-C., Chiang, L.-C. (2009). Knowledge sharing in virtual community: The comparison between contributors and lurkers. In *Proc. Int. Conf. on Electronic Business*, pp. 662–668.

Lurking and online behavioral models (1/8)

Online Community

| Group Identity | Usability | Pro-sharing Norm | Reciprocity | Reputation |

Commitment

Affective Commitment

Normative Commitment

Continuance Commitment

Online Behaviors

| Commitment Citizenship Behaviors | Content Provision | Audience Engagement |

Quality Requirement

Individual

| Personal Characteristics | Goals | Desires | Needs | Self-efficacy |

Environmental factors that affect the user's feeling and the user's willingness to contribute

Development and spread of community norms, Contribution of valuable resources, and Consumption of resources

Personal characteristics of the users

Factors based on the relationships between the users and the community

Sun, N., Rau, P. P.-L., Ma, L. (2014). Understanding lurkers in online communities: A literature review. *Computers in Human Behavior*, 38, 110–117.

Lurking and online behavioral models (2/8)

- **Online community factors**
  - **Group identity**
    - Cognitive state of the users and their affective connections with the community
    - The higher the group identity
      - the greater the amount of member contributions
      - the easier the adaptability of newcomers to the environment
  - **Usability**
    - affected by the sense of community (membership, emotional connection, influence) [Zhang, 2010]
  - **Pro-sharing norms**
    - Stimulate members to share their knowledge – public good that belongs to the community
    - Solicit member contributions and develop the sense of giving back to the community
  - **Reciprocity**
  - **Reputation**
    - The more high-reputation members in the community, the higher the willingness to share information

Zhang, Z. (2010). Feeling the sense of community in social networking usage. *IEEE Trans. Engineering Management*, 57(2), 225–239.

Lurking and online behavioral models (3/8)

- **Commitment factors**
  - Organizational commitment theory: 3 types of bonds [Meyer & Allen, 1991]
    - **Affective commitment**
      - individual's emotional attachment to, identification with and involvement in an organization
    - **Normative commitment**
      - individual's sense of obligation to continue to be a member of the community
    - **Continuance commitment**
      - consequence of an individual's awareness of the costs associated with leaving an organization

- Different types of commitment drive different online behaviors [Bateman et al., 2006]
  - affective and normative commitment stimulate community citizenship behavior
  - affective and continuance commitment motivate content provision behaviors
  - continuance commitment alone drives audience engagement behaviors

Meyer, J. P., Allen, N. J. (1991). A three-component conceptualization of organizational commitment. *Human Resource Management Review*, 1(1), 61–89.

Bateman, P. J., Gray, P. H., Butler, B. S. (2006). Community commitment: How affect, obligation, and necessity drive online behaviors. In Proc. *ICIS*.
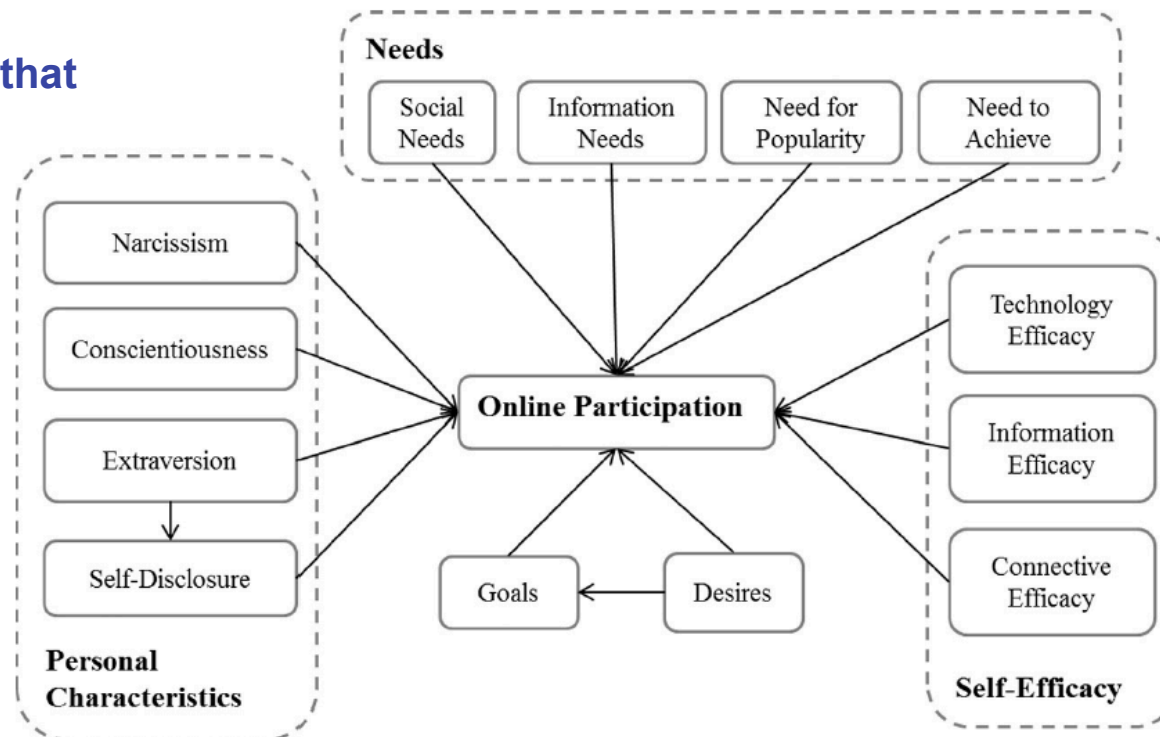

Lurking and online behavioral models (4/8)

- **Quality requirement factors**
  - Influence how users think of the community and therefore shape the online activities
  - [Du, 2006] users' expectations of the community in terms of
    - security,
    - privacy,
    - convenience,
    - reliability
  - The more the community is considered protected,
    the more the users are willing to participate

Du, Y. (2006). Modeling the behavior of lurkers in online communities using intentional agents. *In Proc. Int. Conf. on Intelligent Agents, Web Technologies and Internet Commerce*.

Lurking and online behavioral models (5/8)

Individual factors that influence online behaviors

Sun, N., Rau, P. P.-L., Ma, L. (2014). Understanding lurkers in online communities: A literature review. *Computers in Human Behavior*, 38, 110–117.

Lurking and online behavioral models (6/8)

- **Individual factors**
  - Perceived **self-efficacy**
    - user's belief in her/his ability to influence events that affect life
    - Self-efficacy is task specific: e.g., computer self-efficacy refers to one's confidence to use computers
    - Forms of self-efficacy influencing one's desire and confidence to contribute [Tedjamulia et al., 2005]
      - technology, information, or connective efficacy

  - **Goals** [Du, 2006]:
    - having a conversation
    - reading stories and experiences of others
    - entertainment
    - finding answers to questions
    - building a sense of community

Tedjamulia, S. J., Dean, D. L., Olsen, D. R., Albrecht, C. C. (2005). Motivating content contributions to online communities: Toward a more comprehensive theory. In *Proc. HICSS.*

Lurking and online behavioral models (7/8)

- **Individual factors**

  - **Extraversion, conscientiousness, narcissism**

    - Might be positively correlated to activity and interaction
      - e.g., Facebook and MySpace users (undergraduate students) with high conscientiousness are more likely to send private messages [Muscanell & Guadagno, 2012]
      - e.g., Facebook narcissist users are more active in updating their status, uploading photos, attaining friends [Buffardi & Campbell, 2008]

    - Positively correlated to **self-disclosure**, which leads to intensity of Facebook check-in [Wang & Stefanone, 2013]

Muscanell, N. L., Guadagno, R. E. (2012). Make new friends or keep the old: Gender and personality differences in social networking use. *Computers in Human Behavior*, 28(1), 107–112.

Buffardi, L. E., Campbell, W. K. (2008). Narcissism and social networking web sites. *Personality and Social Psychology Bulletin*, 34(10), 1303–1314.

Wang, S. S., Stefanone, M. A. (2013). Showing off? Human mobility and the interplay of traits, self-disclosure, and Facebook check-ins. *Social Science Computer Review*, 31(4), 437–457.

Lurking and online behavioral models (8/8)

- **Individual factors**
  - **Needs**
    - Socialize with others (social needs)
      - Positively correlated to the intention to stay [Han et al., 2007]
    - Present one's identity to others (self-expression needs)
      - Positively correlated to the willingness to spend money on the community [Han et al., 2007]
    - Epistemic curiosity (information needs)
      - found as more important than interaction (conversation and activities) [Nonnecke & Preece, 2001]
      - found as more present in posters than in lurkers [Han et al., 2007]
    - Popularity and Achievement
      - Positively correlated with the extent of contribution [Tedjamulia et al., 2005]

Han, J. J., Zheng, R. J., Xu, Y. (2007). The effect of individual needs, trust and identification in explaining participation intentions in virtual communities. In *Proc. HICSS*.
Nonnecke, B., Preece, J. (2001). Why lurkers lurk. In *Proc. AMCIS*, pp. 1–10.

Why lurkers lurk (1/4)

- Four main motivational factors [Sun et al., 2014]:
  1. Environmental influence determined by the online community
  2. Personal preference related to an individual's personality
  3. Relationships between the individual and the community
  4. Security considerations

Sun, N., Rau, P. P.-L., Ma, L. (2014). Understanding lurkers in online communities: A literature review. *Computers in Human Behavior*, 38, 110–117.

Why lurkers lurk (2/4)

1. **Environmental influence**
   - Bad usability/interaction design
   - "Too many or too few messages to deal with"
   - Poor quality of the posted contents
   - "Don't know how to post"
     - [Nonnecke et al., 2004] Survey of 1188 users from 375 MSN online communities: 7.8% of lurkers
       - caused by poor usability and insufficient usage guidance
   - Low response rate and long response delay
   - Low reciprocity
     - [Fan et al., 2009] Survey with 207 valid responses (74% of lurkers)
     - Leads to think that "posting has no value to me"
   - "Others respond the way I would"
   - "Just reading/browsing is enough", "No requirement to post"
     - [Kucuk, 2010] Survey of 1078 online course students: 31.1% of lurkers

Nonnecke, B., Preece, J., Andrews, D., Voutour, R. (2004). Online lurkers tell why. In *Proc. AMCIS*.
Kücük, M. (2010). Lurking in online asynchronous discussion. *Procedia-Social and Behavioral Sciences*, 2(2), 2260–2263.

Why lurkers lurk (3/4)

2. **Personal reasons**

- Introversion, lack of self-efficacy, bashfulness [Nonnecke et al., 2004]
- Lack of confidence in the ability to post [Lee al., 2006]
  - 40% of inactive students of an online program [Beaudoin, 2002]
- "Don't feel comfortable writing ideas online"
  - 25% of inactive students of an online program [Beaudoin, 2002]
- No need to post – only seeking for information
- Nothing to post or lack of expertise
- "Others had already posted similarly"
- Time constraints

Lee, Y.-W., Chen, F.-C., Jiang, H.-M. (2006). Lurking as participation: A community perspective on lurkers' identity and negotiability. In *Proc. Conf. on Learning Sciences*, pp. 404–410.
Beaudoin, M. F. (2002). Learning or lurking?: Tracking the "invisible" online student. *The Internet and Higher Education*, 5(2), 147–155.

Why lurkers lurk (4/4)

3. ## Relationships reasons

    - Low verbal and affective intimacy with other members
        - *Social penetration theory* [Altman & Taylor, 1973]: intimacy develops over time to the extent that members reciprocate disclosures
    - Lack of commitment to the group
    - Fear making a commitment
    - Don't want to spend too much time/resources to maintain a commitment

4. ## Security reasons

    - Worrying about that posting will violate privacy [Nonnecke & Preece, 2001]
    - The community does not satisfy requirements of security and privacy, at different levels [Wang et al., 2011]

Altman, I., Taylor, D. A. (1973). *Social penetration: The development of interpersonal relationships*. New York: Holt, Rinehart & Winston.
Wang, Y., Norice, G., Cranor, L. F. (2011). Who is concerned about what? A study of American, Chinese and Indian users' privacy concerns on social network sites. In *Proc. Trust and Trustworthy Computing*, pp. 146–153. Springer.

Why lurkers lurk:
Intimacy and lurking

- People go to SN sites mainly for satisfying social-emotional needs rather than informational needs
  - because user relations are more direct and interpersonal than in group-organized forums
- The level of verbal and affective intimacy in Wallop was found having a positive influence on posting frequency, respectively
- Discriminant analysis showed that verbal and affective intimacy levels can be used to discriminate lurkers and posters
  - Posters have higher verbal intimacy and higher affective intimacy than lurkers

- *People lurk in SNSs because they believe that their social-emotional needs may not be satisfied even if they post*

Rau, P.-L. P., Gao, Q., Ding, Y. (2008). Relationship between the level of intimacy and lurking in online social network services. *Computers in Human Behavior*, 24(6), 2757–2770.

Why lurkers lurk:
User's concern for information privacy and lurking (1/3)

- SNs encourage their users to self-disclose their personal information

- Predictors of privacy concern
  - personal traits, prior privacy experience, computer anxiety

- Lurking as a conservative approach to protect personal information

- Does CFSMIP mediate the relationship between both lurking and computer anxiety and user's behavioral intentions?

- Data: 310 responses from web-based survey (undergrad. college students)
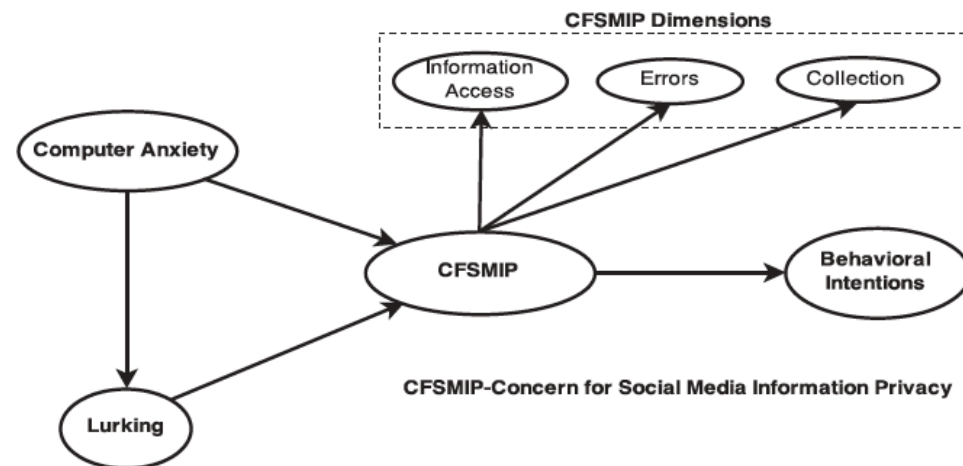

Osatuyi, B. (2015). Is lurking an anxiety-masking strategy on social media sites? The effects of lurking and computer anxiety on explaining information privacy concern on social media platforms. *Computers in Human Behavior*, 49, 324–332.

Why lurkers lurk:
User's concern for information privacy and lurking (2/3)

- **Behavioral intentions**
  - the consumer's future intention to use technologies that organizations (and online merchants) use to gather personal info about their customers in order to better serve them
- *CFSMIP is negatively related to behavioral intentions*

- Self-efficacy theory may be useful to explain how individuals' perception of their abilities (as a function of their social interactions) may influence their concern for information privacy on social media
  - lack of **computer self-efficacy** may lead one to become anxious about the use of computers
- *CFSMIP is positively related to computer anxiety*

Osatuyi, B. (2015). Is lurking an anxiety-masking strategy on social media sites? The effects of lurking and computer anxiety on explaining information privacy concern on social media platforms. *Computers in Human Behavior*, 49, 324–332.
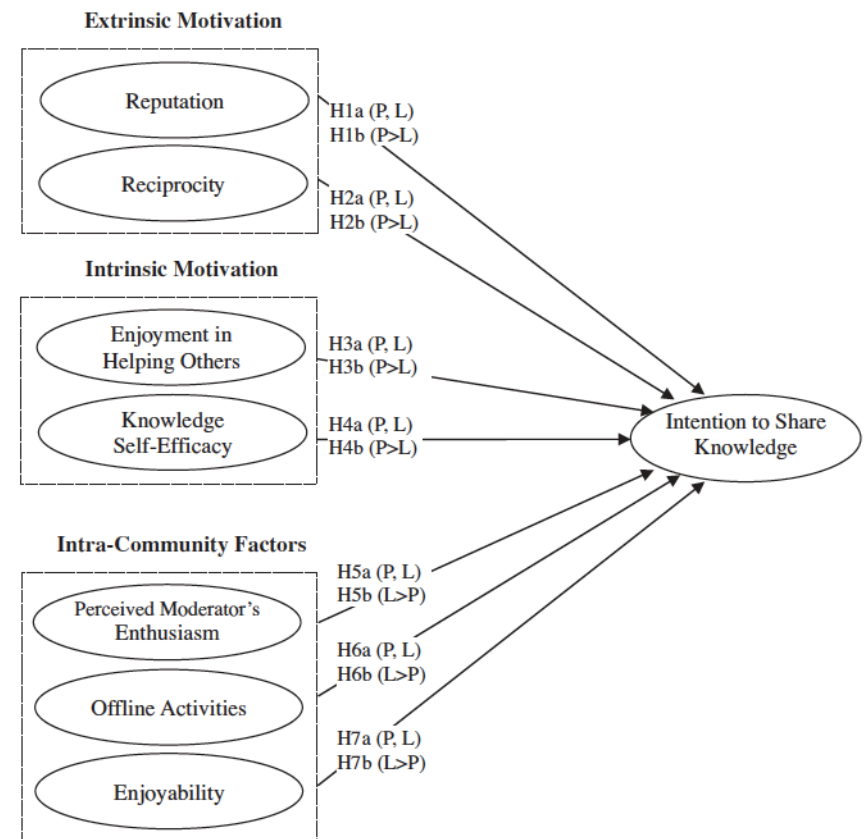

Why lurkers lurk:
User's concern for information privacy and lurking (3/3)

- Lurkers spend a good amount of time to learn the netiquette before making any decision to join conversations

- Lurkers are less likely to be concerned about privacy of their information
  - Since their objective is to access information rather than contribute information

- *CFSMIP is negatively related to lurking*

- *Anxious users may resort to lurking*

Osatuyi, B. (2015). Is lurking an anxiety-masking strategy on social media sites? The effects of lurking and computer anxiety on explaining information privacy concern on social media platforms. *Computers in Human Behavior*, 49, 324–332.

Why lurkers lurk:
Extrinsic, intrinsic, intra-community factors (1/4)

- **Value theory**: different groups of people may hold different types of values that influence their social behavior

  Harper, F. A. (1974). *An introduction to value theory*. Institute for Humane Studies, Studies in Economics.

- Lurkers *versus* Posters

  - Relationships between a motivating factor of some type and the intention to share knowledge
  - Data collected through an online survey posted on the Mobile01 site:
   - 146 posters and 178 lurkers

  Lai, H.-M., Chen, T. T. (2014). Knowledge sharing in interest online communities. *Computers in Human Behavior*, 35, 295–306.

Why lurkers lurk:
Extrinsic, intrinsic, intra-community factors (2/4)

- **Reputation**: perception of an improvement in reputation and image due to sharing knowledge in the online community
  - R1: *Reputation does not significantly influence the knowledge-sharing intention of lurkers or posters*

- **Reciprocity**: belief that current knowledge contribution behavior leads to future requests for knowledge being met
  - R2: *The positive relationship between reciprocity and the intention to share knowledge is stronger for lurkers than posters*
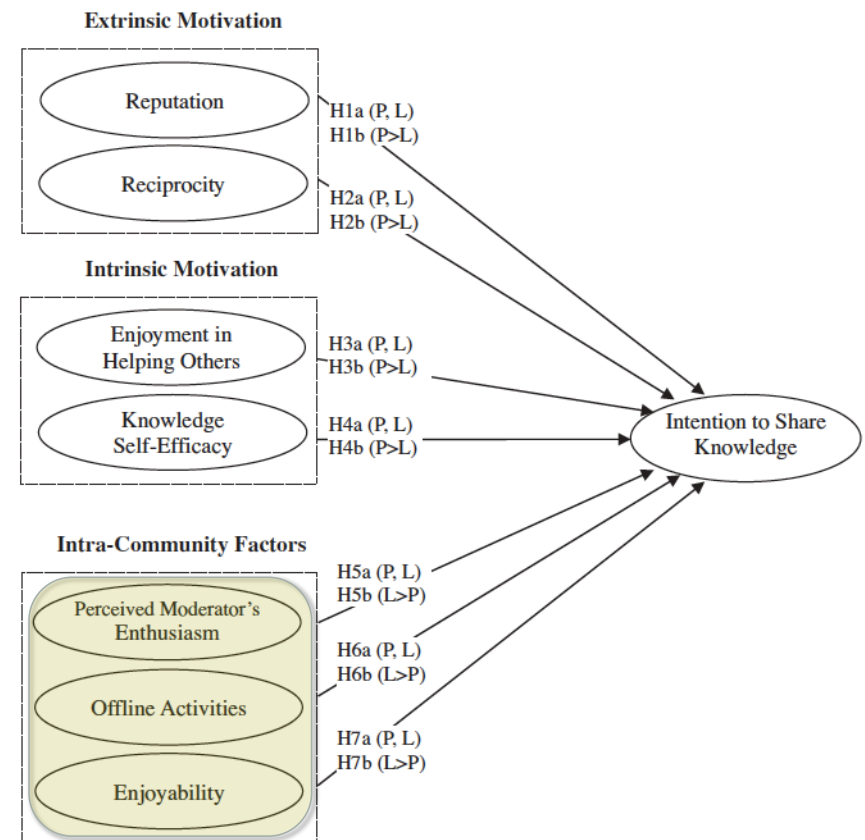

Lai, H.-M., Chen, T. T. (2014). Knowledge sharing in interest online communities. *Computers in Human Behavior*, 35, 295–306.
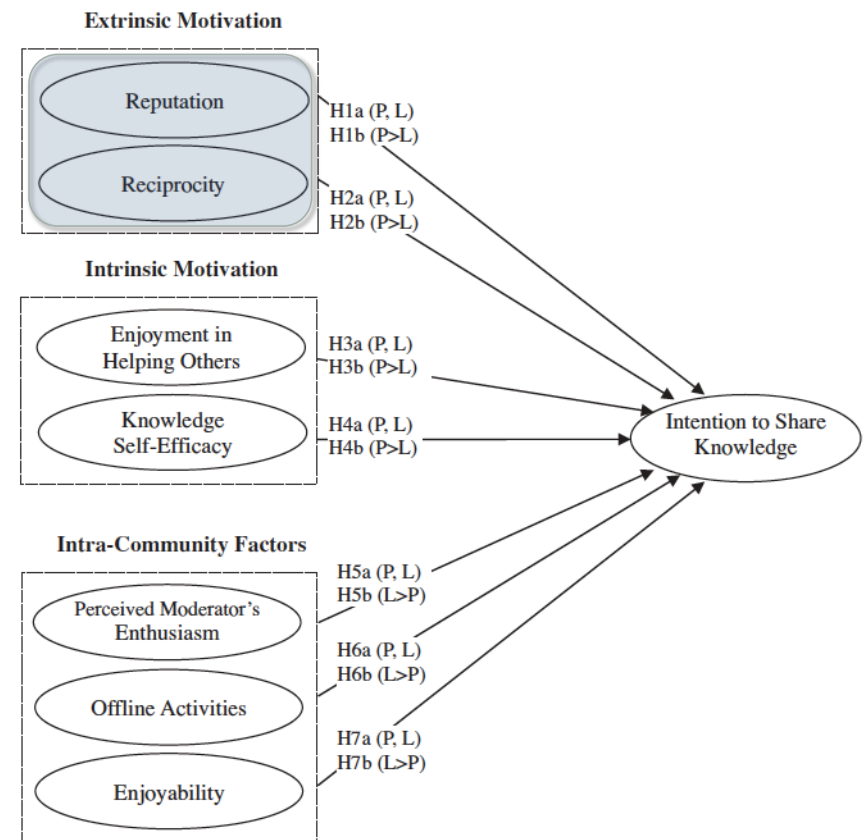

Why lurkers lurk:
Extrinsic, intrinsic, intra-community factors (3/4)

- **Enjoyment in helping others**: perception of pleasure from helping others through sharing knowledge with the online community
  - R3: *The positive relationship between enjoyment in helping others and the intention to share knowledge is stronger for posters than for lurkers*

- **Knowledge self-efficacy**: degree of confidence in one's ability to provide knowledge that is valuable to others
  - R4: *The positive relationship between knowledge self-efficacy and the intention to share knowledge is stronger for posters than for lurkers*

Lai, H.-M., Chen, T. T. (2014). Knowledge sharing in interest online communities. *Computers in Human Behavior*, 35, 295–306.

Extrinsic Motivation

- Reputation — H1a (P, L) / H1b (P>L)
- Reciprocity — H2a (P, L) / H2b (P>L)

Intrinsic Motivation

- Enjoyment in Helping Others — H3a (P, L) / H3b (P>L)
- Knowledge Self-Efficacy — H4a (P, L) / H4b (P>L)

Intra-Community Factors

- Perceived Moderator's Enthusiasm — H5a (P, L) / H5b (L>P)
- Offline Activities — H6a (P, L) / H6b (L>P)
- Enjoyability — H7a (P, L) / H7b (L>P)

Intention to Share Knowledge

Why lurkers lurk:
Extrinsic, intrinsic, intra-community factors (4/4)

- **Perceived moderator's enthusiasm**
  - R5: *The positive relationship between perceived moderator's enthusiasm and the intention to share knowledge is stronger for lurkers than for posters*

- **Offline interaction**
  - R6: *The positive relationship between offline activities and the intention to share knowledge is stronger for lurkers than for posters*

- **Enjoyability**: perception of enjoyment or playfulness derived from the community's content and interactions with others
  - R7: *Enjoyability influences the knowledge-sharing intention of lurkers as well as posters*

Lai, H.-M., Chen, T. T. (2014). Knowledge sharing in interest online communities. *Computers in Human Behavior*, 35, 295–306.

The challenge of "de-lurking"

Provide an environment that makes people's lives easier

How to promote de-lurking (1/2)

- **External stimuli** – *Social Exchange theory* [Thibaut & Kelley, 1959]
  - Providing rewards and removing negative consequences will strengthen intentions
  - Main actions:

    Thibaut, J. W., & Kelley, H. H. (1959). *The social psychology of groups* (Vol. XIII). Oxford, England: John Wiley.

    - Tangible or intangible rewards
    - Controlling or informative rewards

- **Encouragement to participate** [Nonnecke et al., 2004; Du, 2006]
  - Helps to set up a pro-sharing norm
  - Enhances users' commitment to the community
  - Improves users' confidence in expressing themselves
  - Make lurkers understand the necessity of their contribution
  - Main actions:
    - Welcome statements, introduction of reward rules, support for browsing and praise for the moderator

Sun, N., Rau, P. P.-L., Ma, L. (2014). Understanding lurkers in online communities: A literature review. *Computers in Human Behavior*, 38, 110–117.

How to promote de-lurking (2/2)

- **Usability improvement** [Nonnecke et al., 2004, 2006; Du, 2006]
  - Simplify the procedures to send/respond messages
  - Rearranging the presentation of messages

- **Guidance for newcomers** [Du, 2006]
  - Newcomers are likely to lurk for a while to learn the culture of the community
  - Help from elder/master users
  - Periodically provide opportunities to join conversations

Sun, N., Rau, P. P.-L., Ma, L. (2014). Understanding lurkers in online communities: A literature review. *Computers in Human Behavior*, 38, 110–117.

Lurking as a computational problem

- Hot topic in social science and computer-human interaction
- Also becoming mature in computer science

- Emergence for computational models, methodologies, and algorithms for
  - Understanding lurking behaviors
  - Utilizing the mined knowledge in next-generation
    - marketing-oriented applications
    - E-learning platforms
    - Collaborative systems
    - Trust systems

MODELING LURKING BEHAVIORS

- In-degree, Out-degree and Lurking
- Topology-driven Lurking definition

Modeling lurking behaviors (1/4)

- Social network as a **graph**
  - Users as nodes
  - User relations as edges

- Objective:
  - Define a **lurking score** function
  - Use this function to produce a **ranking of users** at different degrees of lurking

- Assumptions:
  - edges are directed
    - i.e., user relations are asymmetric: *followships*, or *interactions*
    - In-neighbors, out-neighbors
  - nodes correspond to users only
  - (optionally) edge weights might be provided

Modeling lurking behaviors (2/4)

- Centrality in (social) networks
  - Many definitions, function of
    - Local topology structure
      - Degree, closeness, betweenness
    - Global topology structure
      - Propagation and attenuation of information
      - PageRank, hubs and authorities, etc.
  - Can be topic-biased
    - e.g., TwitterRank
- Other terms: prestige, importance, authoritativeness, influential status, etc.

- What about "*lurking centrality*"?

Modeling lurking behaviors (3/4)

- User interactions in a SN are typically modeled as **influence-oriented relationships**, to identify and rank **influential users**

twitter
the more followers a user has,
the more interesting his/her published tweets

follows

follows
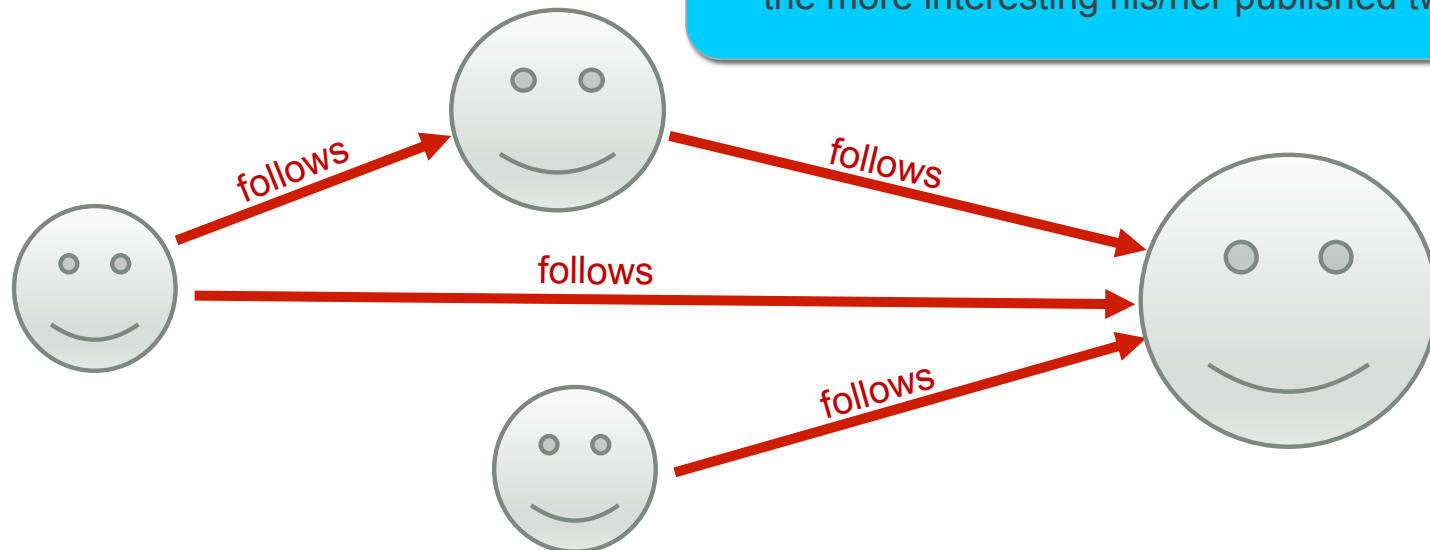

follows

follows

Modeling lurking behaviors (4/4)

The greater the amount of information a node receives, the more likely it corresponds to a lurker

if **user *A* follows user *B***, then *A* is benefiting from *B*'s information (i.e., *A* is receiving *B*'s tweets) ➔ **link from *B* to *A***

is followed by

Topology-driven definition of lurking (1/3)

Modeling the mutual contribution from incoming and outgoing links through the **in/out-degree**

Is in/out-degree correlated with in-degree?
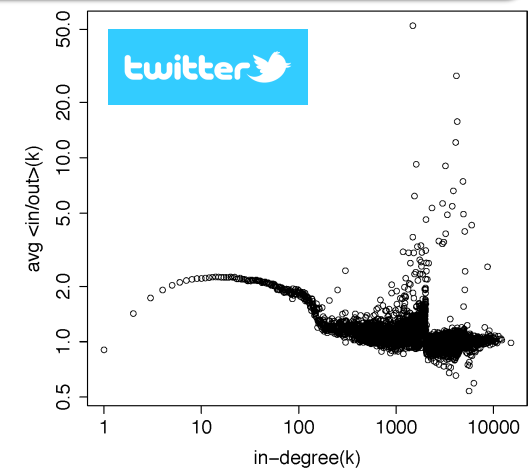

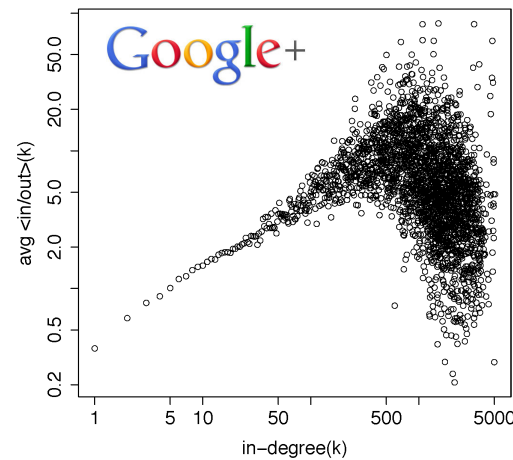

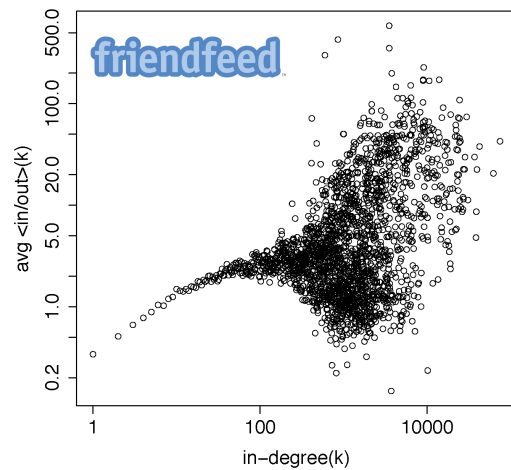

Topology-driven definition of lurking (2/3)

- Need to capitalize on a node's incoming and outgoing connections

The strength of the lurking status of a node is proportional to:

Principle I - Overconsumption:
- its own in/out-degree

Principle II - Authoritativeness of the information received:
- the influential (non-lurking) status of its in-neighbors

Principle III: Non-authoritativeness of the information produced:
- the lurking status of its out-neighbors

Topology-driven definition of lurking (3/3)
Lurking coefficient

- Basic lurking-related property of the network topology
  - Conforms to the three principles of lurking

- Local measure based on *in-neighbor* (B) and *out-neighbor* (R) sets

- Node-level Lurking Coefficient:

$$lc_i = \frac{1}{|V_i|}\left(\sum_{j \in B_i} I\left\{ \frac{in(j)}{out(j)} < \frac{in(i)}{out(i)} \right\} + \sum_{j \in R_i} I\left\{ \frac{in(j)}{out(j)} \geq \frac{in(i)}{out(i)} \right\} \right)$$

- Weighted average of node-level lurking coefficient (*LC*):

$$LC = \frac{1}{|V|} \sum_{i \in V} p_i \times lc_i$$

A. Tagarelli, R. Interdonato (2014)

In *Proc. ASONAM'13*

LURKER RANKING METHODS

- In-neighbors- and out-neighbors-driven lurking definitions
- PageRank and AlphaCentrality based formulations

In-neighbors-driven lurking

$$r_i = \frac{1}{out(i)} \sum_{j \in B_i} \frac{out(j)}{in(j)} r_j$$

The score of a node increases with the number of its in-neighbors and with their likelihood of being non-lurkers (relatively high out/in-degree)

Factor inversely proportional to the node's out-degree accounts for both the contribution of the node's in-neighbors and its own in/out-degree property
Out-neighbors-driven lurking

$$r_i = \frac{in(i)}{\sum_{j \in R_i} in(j)} \cdot \sum_{j \in R_i} \frac{in(j)}{out(j)} r_j$$

The lurking score of a node increases with the tendency of its out-neighbors of being lurkers
Factor scoring a node higher if it receives more than what its out-neighbors receive

In-Out-neighbors-driven lurking

$$r_i = \left(\frac{1}{out(i)} \sum_{j \in B_i} \frac{out(j)}{in(j)} r_j \right) \left(1 + \frac{in(i)}{\sum_{j \in R_i} in(j)} \sum_{j \in R_i} \frac{in(j)}{out(j)} r_j \right)$$

Aspect related to the strength of non-lurking behavior of in-neighbors is dominant – it's expected to have a better fit of the hypothetical likelihood function for a given node

LurkerRank methods (1/2)

- Specification in terms of classic **PageRank** [Brin & Page, 1998] and **alpha-centrality** [Bonacich & Lloyd, 2001]
  - PageRank equations

  $$\mathbf{r} = \alpha\mathbf{S}\mathbf{r} + (1-\alpha)\mathbf{v} \qquad r_i = \alpha \sum_{j \in B_i} \frac{r_j}{out(j)} + \frac{1-\alpha}{N}$$

  - Alpha-centrality equations

  $$\mathbf{r} = \alpha\mathbf{A}^T\mathbf{r} + \mathbf{v} \qquad r_i = \alpha \sum_{j \in B_i} r_j + v_i$$

Brin, S., Page, L. (1998). The anatomy of a large-scale hypertextual Web search engine. *Computer Networks and ISDN Systems* 30(1-7), 107-117.
Bonacich, P., Lloyd, P. (2001). Eigenvector-like measures of centrality for asymmetric relations. *Social Networks* 23, 191-201.

LurkerRank methods (2/2)

- PageRank and AlphaCentrality based formulations

  - In-neighbors-driven lurking methods: **LRin**, **ac-Lrin**
  - Out-neighbors-driven lurking methods: **LRout**, **ac-LRout**
  - InOut-neighbors-driven lurking methods: **LRin-out**, **ac-LRin-out**

- e.g.,: **LRin** formulation

$$r_i = \alpha \left(\frac{1}{out(i)} \sum_{j \in B_i} \frac{out(j)}{in(j)} r_j \right) + \frac{(1-\alpha)}{N}$$

Dealing with lack of ground-truth

- Generating a **data-driven ranking** for each evaluation dataset
- **Basic idea**:
  - Directly proportional to a node's in/out-degree
  - Inversely proportional to a SN-specific measure of influence

$$r_i^* = \frac{in(i)}{out(i)} e^{-EI(i)}$$

twitter [Bakshy, et al., 2011]

$$EI(i) = \frac{1}{out(i)} \sum_{j \in R_i} nRetweets(j)$$

friendfeed

$$EI(i) = \frac{\sum_{j \in R_i} nCom(j,i)}{out(i)} \log_{10}(10 + nPosts(i))$$

flickr DD-F

$$EI(i) = \frac{1}{out(i)} \sum_{j \in R_i} nFavorites(j)$$

flickr DD-V

$$EI(i) = \frac{1}{out(i)} \sum_{j \in R_i} nViews(j)$$

Bakshy, E., Hofman, J. M., Mason, W. A., Watts, D. J. (2011). Everyone's an influencer: quantifying influence on Twitter. In *Proc. ACM WSDM*.

Competing methods

- (baseline) In-Out distribution (IO)

- PageRank (PR)

- Alpha-centrality (AC)

- Fair-Bets [Budalakoti & Bekkerman, 2012] (FB)

$$r_i = \frac{1}{out(i)} \sum_{j \in B_i} r_j$$

- Connections among the users are based on the number of sent and accepted invitations
- Fair-Bets can be viewed as a model of social capital accumulation and expenditure
- Assuming users are paying each other to accept invitations on a SN, the fair-bets score of a user is *the amount s/he can afford to pay on average*

Budalakoti, S., Bekkerman, R. (2012). Bimodal invitation-navigation fair bets model for authority identification in a social network. In *Proc. ACM WWW*.

Assessment criteria (1/2)

- **Fagin's intersection metric**: determines how well two ranking lists are in agreement with each other, accounting for top-weightedness:

$$F(L^i, L^{ii}, k) = \frac{1}{k} \sum_{q=1}^{k} \frac{L^i_{:q} \cap L^{ii}_{:q}}{q}$$

- **Kendall rank correlation coefficient**: evaluates the similarity between two rankings, expressed as sets of ordered pairs, based on the number of inversions of pairs which would be needed to transform one ranking into the other.

$$Ken(L^i, L^{ii}) = 1 - \frac{(2\Delta(P(L^i), P(L^{ii})))}{(N(N-1))}$$

Assessment criteria (2/2)

- **Bpref (binary preference)**: preference relation of whether judged relevant candidates R of a list L_1 are retrieved, i.e., occur in a list L_2, ahead of judged irrelevant candidates N:

$$Bpref(R,N) = \frac{1}{|R|} \sum_r \frac{1 - (\# \, of \, n \, ranked \, higher \, than \, r)}{|R|}$$

- N: set of nodes with data-driven ranking score below or equal to 1
- R is selected as the set of nodes having top-k% score from the complement of N.

Evaluation goals

- Lurking reciprocity: how lurkers relate to each other?
- Lurkers-active users attachment: how lurker distribution grows w.r.t. active users (and vice versa)?
- Ranking evaluation:
  - Correlation analysis w.r.t. data-driven rankings
  - Comparative evaluation with LurkerRank methods
  - Efficiency performance
- Delurking-oriented randomization
- Percolation analysis

- Qualitative analysis
  - Manually inspecting web profiles of top-lurkers

Reciprocity (1/2)

Impact of the presence of lurkers on measures of reciprocity, based on top-25%, top-10%, and top-5% of a LR solution

	# recip. edges (full graph)	top-25% of the LRin-out solution			top-10% of the LRin-out solution			top-5% of the LRin-out solution		
		# edges (induced graph)	# reciprocal lurking edges	% rle	# edges (induced graph)	# reciprocal lurking edges	% rle	# edges (induced graph)	# reciprocal lurking edges	% rle
Flickr	20,603,483	23,352,367	16,440,872	49.61	12,349,595	8,704,922	26.27	5,030,759	3,192,712	9.63
FriendFeed	3,014,306	340,935	33,654	0.18	1,096	46	<0.01	2	0	0.00
GooglePlus	2,870,336	1,413,468	667,422	4.88	49,481	23,562	0.17	5,310	2,624	0.02
Twitter-Kwak	52,137,192	7,293	2,806	<0.01	216	52	<0.01	64	10	<0.01
Twitter-UDI	191,858,256	18,839,845	10,078,339	3.54	3,094,341	1,198,615	0.42	872,332	271,751	0.10

- Small or negligible
  - fraction of reciprocal lurking edges to the total no. of edges in the original graph (rle)
  - fraction of reciprocal edges in the original graph that connect lurkers to each other
- LRin performed very similarly to LRin-out
- LRout achieved much higher values (as expected)

Reciprocity (2/2)

Fraction of edges that connect lurkers to each other in a lurking-induced subgraph

- Decreasing trend for lurking reciprocity (LRin-out)
  - stagnant on Flickr, GooglePlus, and FriendFeed
  - steeper on Twitter
- Inverse trend when using LRout
Attachment

Distribution of active users
as a function of the lurkers-followers

Distribution of lurkers
as function of the active users-followees

Active users who already are
followed by a large number of lurkers,
are likely to attract even more lurkers

Lurkers who already follow a large
number of active users, are more
likely to do so

Ranking evaluation:
Correlation analysis w.r.t. data-driven rankings

Kendall tau correlation (95% confidence intervals)

Unpaired two-tail t-test

<u>Samples</u>: performance scores obtained by a ranking method w.r.t. DD for each iteration

<u>Null hypothesis</u>: no difference in performance w.r.t. data-driven ranking between a LurkerRank method and a competing method

Useful to confirm that the difference in performance between the LurkerRank methods and the competing ones holds on FriendFeed as well, (despite the high *Bpref* scores observed in most cases)

Ranking evaluation:
Statistical testing – second stage (1/2)

- Data preparation (network-specific): 100 subgraphs extracted, each with a randomly picked seed node and roughly covering a fixed number of nodes (around 1/100 of the original network size)

- **Goal**: to stress the ranking methods performing over a pool of subnetworks with different characteristics

- Paired two-tail t-test, with samples F scores respectively obtained by two ranking methods w.r.t. **DD** over the same randomly generated subgraph
  - k was set to 10^4, hence very high for such network sizes (i.e., around 200,000 nodes)

Ranking evaluation:
Statistical testing – second stage (2/2)

For each pair of LurkerRank method vs. competing method, the null hypothesis of equal means was rejected at 1% significance level (p-values ranging from 1.4E-3 to 2.8E-19 on Twitter)

- Close behavior of the LurkerRank methods (except **LRout** and **ac-LRout**) and **AC** (e.g., around 0.19 F on average, on Twitter)

- Close behavior of **PR** and **FB**, which however achieved a lower average F (e.g., 0.029, on Twitter)

Ranking evaluation:
Efficiency performance of LurkerRank methods

- LRin and LRout have pretty similar runtime

- LRin-out slower than the others
  - on 3 out of 5 networks
  - about twice more than LRin and LRout

- All methods reach ranking stability quickly
  - 35 to 75 iterations
  - much fewer iterations for ac-LRin-out

  (at the cost of poor diversification of the ranking scores)
Qualitative Evaluation

Top-20 by FB:
Most users have never been retweeted

Most of them are spammers or with profiles suspended by Twitter due to violation of terms of service certainly can be considered lurkers

twitter

Delurking-oriented randomization (1/2)

> Using randomized model to enable "**self-delurking**" of a network

- Randomization-like model to simulate introducing of lurkers to active users

- Inserting new links from active users to lurkers
- Requires:
  - cut-off thresholds for the selection of the sets of active users and lurkers
  - probability to control the degree of lurking

- Note both the size of the network and the degree of vertices may change

Algorithm   Delurking-oriented randomization

Input: The topology graph $\mathcal{G} = \langle \mathcal{V}, \mathcal{E} \rangle$ of an OSN. The ranking L corresponding to a LR solution for $\mathcal{G}$. Cut-off percentage thresholds t_1, t_2 of ranking order in L. Probability p. Maximum fraction d of new edges to add to $\mathcal{G}$.

Output: A randomized graph $\mathcal{G}'$.

1: $\mathcal{E}' \leftarrow \emptyset$
2: Sort L by decreasing lurking score
3: Let L_{top} (resp. L_{bottom}) be the top-t_1 (resp. bottom-t_2) of the sorted L
4: $E_{al} \leftarrow \{e = (a,l) \in \mathcal{E} \mid a \in L_{\text{bottom}}, l \in L_{\text{top}}\}$
5: **repeat**
6:    Pick randomly with probability p an edge $(a_1, l_1) \in E_{al} \setminus \mathcal{E}'$
7:    Pick randomly with probability p an edge $(a_2, l_2) \in E_{al} \setminus \mathcal{E}'$, with $a_2 \neq a_1, l_2 \neq l_1$
8:    $\mathcal{E}' \leftarrow \mathcal{E}' \cup \{(l_1, a_2), (l_2, a_1)\}$ /* add the new edges */
9: **until** $(|\mathcal{E}'| \geq d|E_{al}|)$
10: $\mathcal{G}' \leftarrow \langle \mathcal{V}, \mathcal{E}' \cup \mathcal{E} \rangle$

Delurking-oriented randomization (2/2)

- Setting: $p = 0.5$, $t_1 = t_2 = 25\%$, d in [0.2, 1.0] (increment by 0.2)

- Correlation analysis of LR solutions (resp. in/out ranking) *before*/*after* randomization
  - Poor when sinks/sources are discarded
- The top-ranked lurkers can significantly change
  - w.r.t. the original configuration of the network, and
  - also for different degrees of delurking-oriented randomization
  - Less evident on Twitter (larger size, lower CC, higher avgPL)

- **Negligible impact on the in/out-degree distribution**
  - Moderate to high correlation between:
    - in/out ranking in the original network and each of the in/out rankings of the randomized networks
    - the randomized in/out rankings pairwise

Percolation analysis (1/3)

- Assessing topological integrity properties
  - typically via edge removal strategies based on topological overlap measures
- Removing edges by increasing order of topological overlap has shown to effectively detect edges that act as bridges between different communities [Girvan & Newman, 2002]

Using percolation analysis to explain relationships between **lurkers** and **community bridges**

- *Directed* topological overlap: $O(i, j) = \dfrac{|R_i \cap B_j|}{(|R_i| - 1) + (|B_j| - 1) - |R_i \cap B_j|}$

Girvan, M., Newman, M. E. J. (2002). Community structure in social and biological networks. *Proc. Natl. Acad. Sci. (PNAS)* 99(12), 7821-7826.

Percolation analysis (2/3)

- Comparison between
  - set of vertices resulting from edge removal based on increasing topological overlap
  - set of top-ranked lurkers

LRin

LRout

- Matching of top-25% lurkers to the sets of vertices included in the 99th, 95th and 90th percentile of the edges with lowest directed topological overlap
  - At 90th percentile, almost all top-lurkers matched on FriendFeed, GooglePlus, and (by LRin and LRin-out) on the two Twitter networks
 - On FriendFeed and GooglePlus, most top-lurkers matched at 95th

LRin-out
Percolation analysis (3/3)

- What fraction of the vertex set?
  - above 90% on FriendFeed and GooglePlus
  - but below 27% on Twitter

Lurkers can act as community bridges!

- Resilience evaluation: fraction of the maximal strongly CC as function of removed vertices (w/ and w/o sinks)
  - Most disruptive removal strategy based on decreasing LR (w/o sinks)
Main findings

- LurkerRank abilities:
  - Effectiveness in detecting and ranking lurkers confirmed by qualitative examination made on the evaluation SN websites
  - Higher correlation with data-driven ranking than competing and baseline methods
  - Competing methods fail in identifying lurkers:
    - PageRank and alpha-centrality still detect influential users,
    - Fair-Bets tends rather to identify spammers

- Lurking-oriented network analysis:
  - Lurkers are not very prone to reciprocate each other
  - Lurkers may be related to users playing the role of bridges between communities (under lurking-oriented graph model)
  - Self-delurking randomization can be useful to change the top-ranked lurkers in the network, while scarcely affecting the in/out degree distribution

A. Tagarelli, R. Interdonato (2014)
Understanding lurking behaviors in social networks across time.
In *Proc. ASONAM'14*

EXPERIMENTAL EVALUATION

Understanding lurking behaviors over time

Understanding lurkers over time

Do lurkers match to zero-contributors?

Do lurkers match newcomers?

How frequently do lurkers respond to the others' actions?

Do lurkers create preferential relations with active users?

How does lurking behavior evolve?

How do topical interests of lurkers evolve?

Time-varying snapshot graphs

- **Interaction graph:** Useful to represent evolving/dynamic lurking behavior:
  - Subgraphs of the *static* followship graph
  - Edges represent interactions among users in a certain time interval
    - Friendfeed and Instagram: **comment-based interactions**
    - Flickr: **favorite-based interactions**

receives a comment/like from

- **Timestamped followship graph** [only for Flickr]

data	# nodes	# links	avg in-deg.	avg path len.	clust. coef.	assorta-tivity
averages over time-varying snapshot graphs						
Flickr-social	1,889,102	25,265,343	13.25	4.41	0.108	0.009
Flickr	215,429	1,483,462	6.85	4.69	0.025	-0.013
FriendFeed	6,962	64,509	5.15	5.89	0.071	-0.043
Instagram	10,353	31,215	2.94	5.83	0.083	0.217

| data	start date	end date
Flickr-social	2006-11-02	2007-05-17
Flickr	2006-09-08	2007-03-22
FriendFeed	2010-04-09	2010-09-30
Instagram	2012-06-28	2013-12-18

Lurkers vs. inactive users: static analysis

- How much the set of zero-contributors overlaps with the set of "*potential lurkers*" (i.e., users with in/out >1)?
  - 12% (favorite-based interaction network in Flickr)
  - 72% (comment-based interaction network in FriendFeed)
  - 95% (comment-based interaction network in Instagram)

(Potential) lurkers are more likely to behave similarly to inactive users when lurkers' activity is regarded in terms of "comments"
Lurkers vs. inactive users: temporal analysis
- Temporal trends of overlap ratios w.r.t.:
  - potential lurkers
  - top-5% ranked lurkers by LRin-out
  - top-25% ranked lurkers by LRin-out

- Inset: distributions of potential lurkers and zero-contributors follow close trends (at different scales)

Overlap ratios remain rather unaffected over time

Lurkers vs. newcomers (1/3)

- A user is a newcomer at time *t* if she is not involved in any discussion at any time *t'<t*

- Lurkers identified at each time *t*

- **Favorite-markings interactions:**
  - *Lurkers matching Newcomers*: 30% down to 20% over time, regardless of the top-%
  - *Newcomers matching Lurkers*: more constant, slightly increasing. Fraction depends on the top-%.

Lurkers vs. newcomers (2/3)
- **Comment-based interactions:**
  - *Lurkers matching Newcomers*: 50% down to 20% over time
  - *Newcomers matching Lurkers*: roughly constant over time
- **Difference in matching:**
  - Inherent characteristics of an OSN
  - Type of interaction

Lurkers vs. newcomers (3/3)

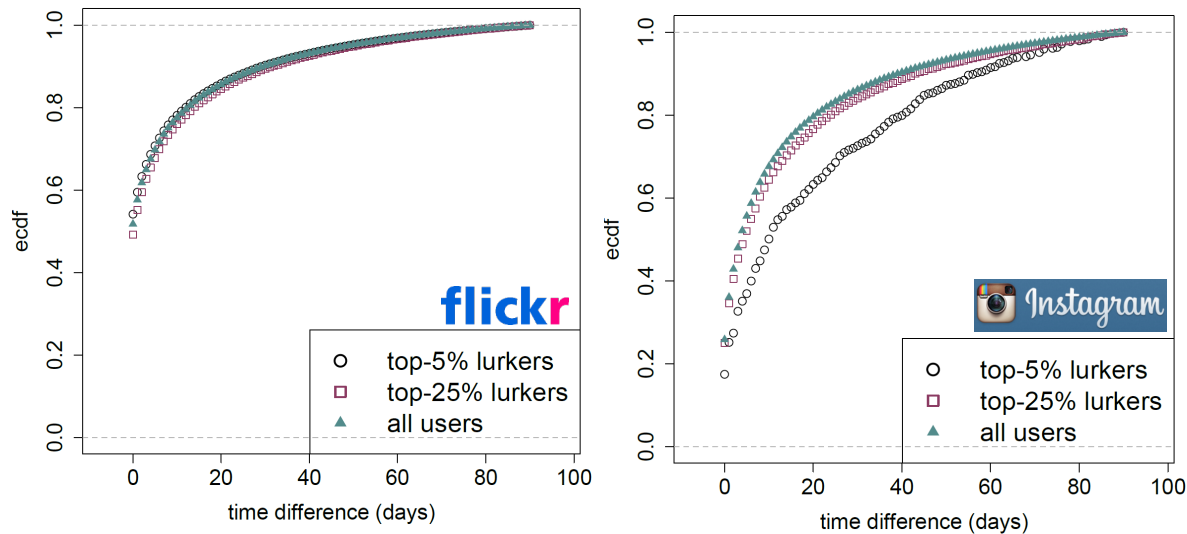

- **Comment-based interactions:**
  - *Lurkers matching Newcomers*: decreasing trend, below 10% on average

Newcomers' behavior is a form of observational learning [Bandura, 1986]

Observational learning and lurking are related to each other

Bandura, A. (1986). *Social foundations of thought and action: A social cognitive theory*. Englewood Clis, NJ, Prentice Hall.
Responsiveness

- Distribution of time differences (in days) between any two consecutive responsive actions made by a user w.r.t. a post created by her/his followees
- Timespan: 90 days
- Responses:
  - "favorites" on Flickr, "comments" on Instagram

- On Flickr:
  - about 18 days to observe 80% of responses for the top-ranked lurkers
- On Instagram:
  - about one month to observe the 80% of responses for the top-25% lurkers
  - even longer (more than 40 days) for the top-5% lurkers

Lurkers tend to react more slowly (up to 20 days more in Instagram)

Gap is reduced to a few days when taking into account a larger fraction of lurkers (top-25%)

Preferential attachment (1/2)

- Studying the new connections received by active users for any *k* lurkers (averaged per user and per week)

- The number of lurkers shows a good linear correlation with the average number of new links received by active users
  - i.e., preferential attachment

- Active users receive on average one new connection per week from lurkers for every 120 connections (lurkers) that they already have

Preferential attachment (2/2)

new links produced (per lurker/week)
no. of active users (k)
flickr

- Studying the new connections produced by lurkers for any *k* active users (averaged per user and per week)

  > **Are lurking connections attached preferentially to active users that already have a large number of connected lurkers?**

- No preferential attachment

  > Lurkers that have a higher number of active users as followees are NOT more likely to create new connections to other active users
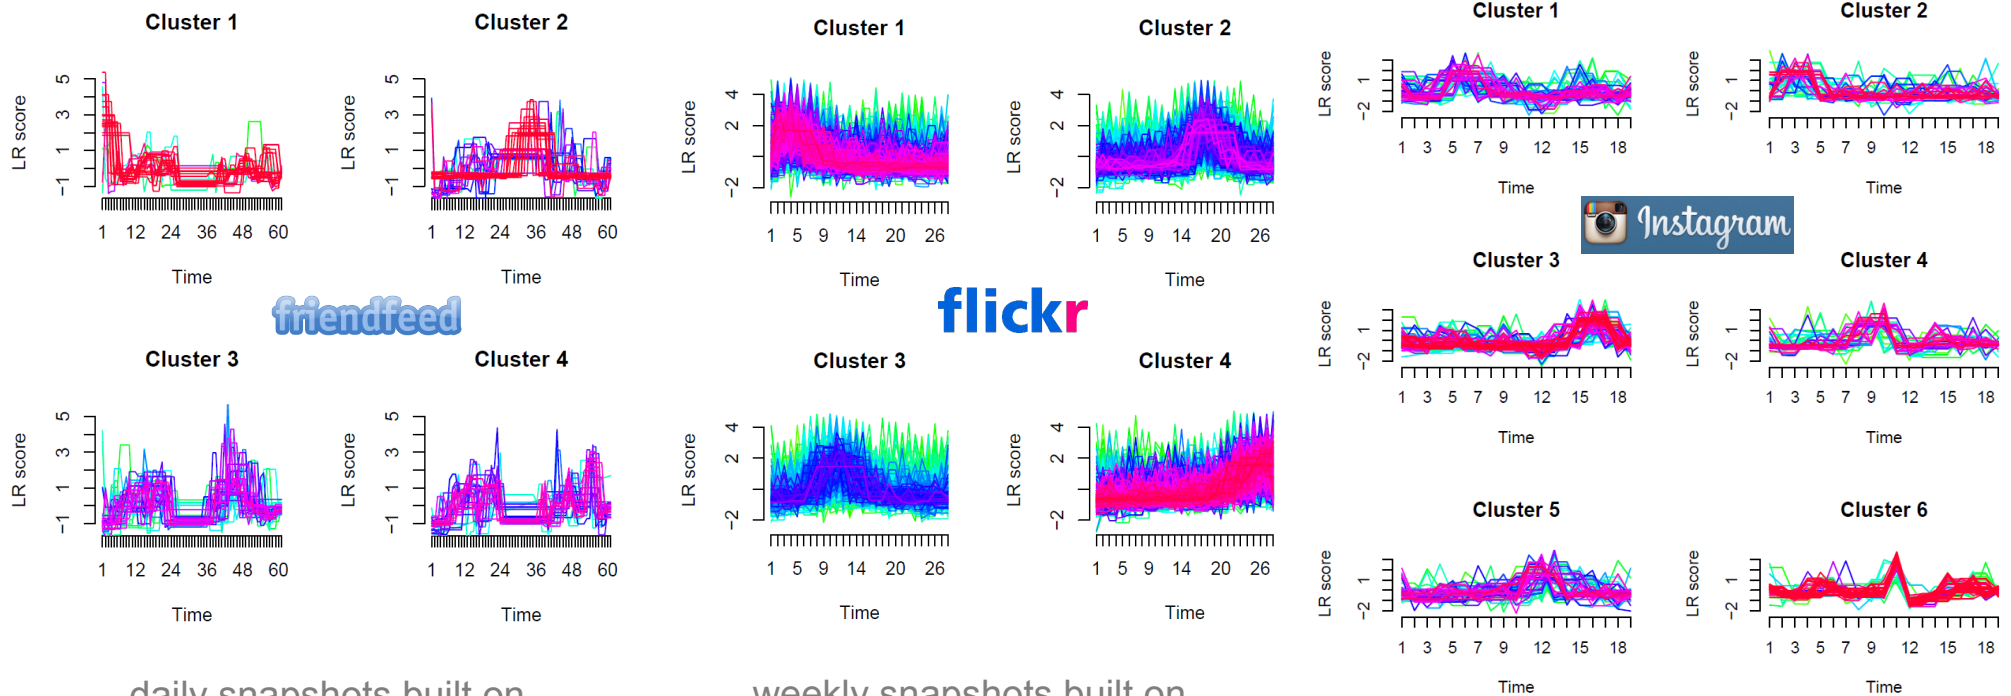

Temporal trends and clustering (1/3)

Aim: **To detect structures hidden in the lurking trends that vary over time**

Task: **Clustering of time series representing the users' lurking profiles**

- Repeatedly applying LurkerRank to successive snapshots of a network
- Time series of the normalized LurkerRank scores for every user in the dataset
- Soft clustering over the set of time series using fuzzy c-means clustering
  - For each network, we initially selected the top-25% lurkers at time zero
  - Only users appearing in at least 50% of the subsequent snapshots

Mfuzz R-package tool: http://www.bioconductor.org/packages/release/bioc/html/Mfuzz.html.

Temporal trends and clustering (2/3)

daily snapshots built on
"likes + comments"

weekly snapshots built on
"favorites"

monthly snapshots built on
"comments"

Temporal trends and clustering (3/3)

Clearer trends, more homogeneous clusters according to least-effort interactions (e.g., "likes"/"favorites")

More noisy clusters according to time-consuming interactions

Lurking series do not tend to group into decreasing trends

i.e., lurkers are not likely to spontaneously "de-lurk" themselves

Topical evolution: LDA-learned topics

LDA topic ids	topic-set label	main descriptors (i.e., media tags) of topic-set	subnetwork-induced size
0, 6, 10	nature	sky, sunset, whpflowerpower, whpsignsoftheseason, clouds, nature, landscape, sea, beach, flowers, water, trees, hinking, summer, fall, autumn	8,185

9, 15	photo art	whpsilhouettes, whpselfportrait, whplookingup, whpreflectagram, , selfie, blackandwhite, whpbehindthelens, whpstilllife, silhouette, bnw, monochrome	11,882

- Statistical topic modeling: Latent Dirichlet Allocation (LDA)

- Tags occurring in less than 5 documents or in more than 75% of the documents were filtered out

- Among models with 5<*topics*<50, 20 topics model was the most *interpretable* one

- Finer-grain topics learned by LDA were aggregated in thematically-cohesive *topic-sets*

Topical evolution: Topic-specific subgraphs
- Top-ranked lurkers in snapshot graphs vs Top-ranked lurkers in topic-specific subgraphs
- **Overlap score**: intersection of top-ranked lurkers normalized over the sum of intersection values obtained over all topics
- Full graph: relatively good matching between *generic* and *topic-specific* lurkers

Lurkers are more likely to focus on well categorized contents

Topical evolution: Transition diagrams (1/2)
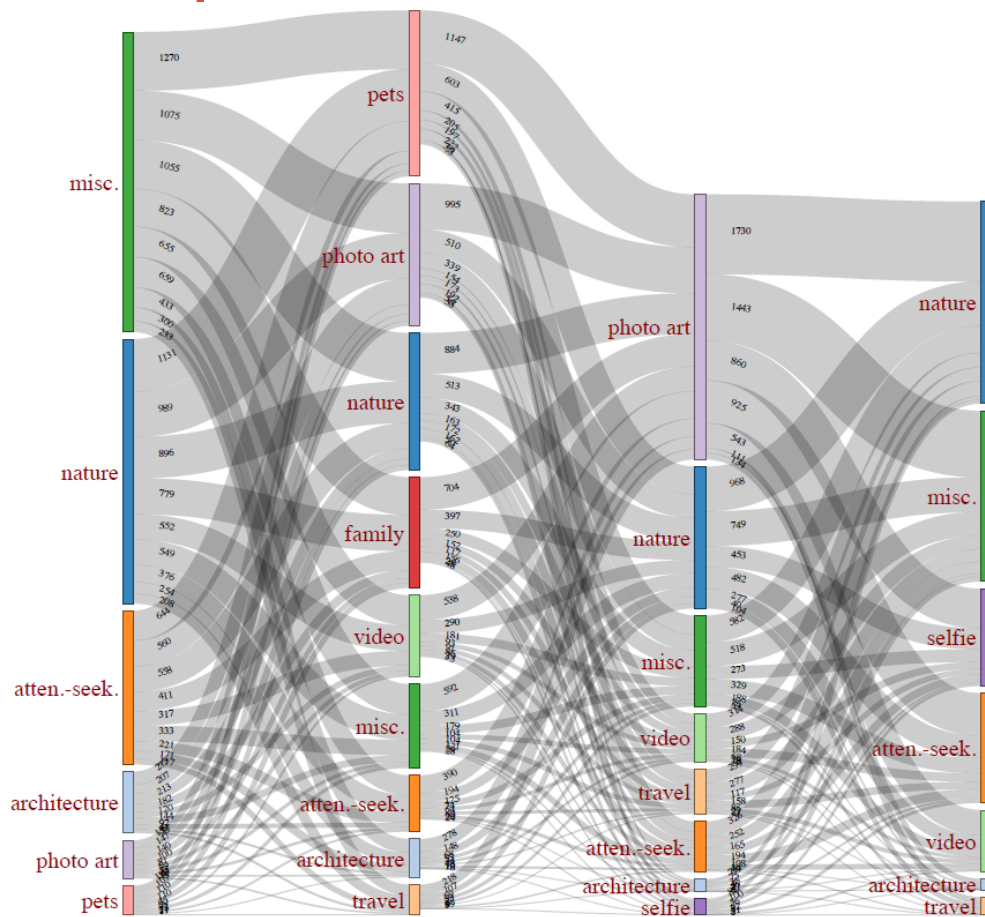

- **All user** transitions from one *topic-set* to another during the quarters of year 2013
- A core of *topic-sets* is always present over time (with varying proportions)

- Topical usage patterns **continuously change over time**

Topical evolution: Transition diagrams (2/2)
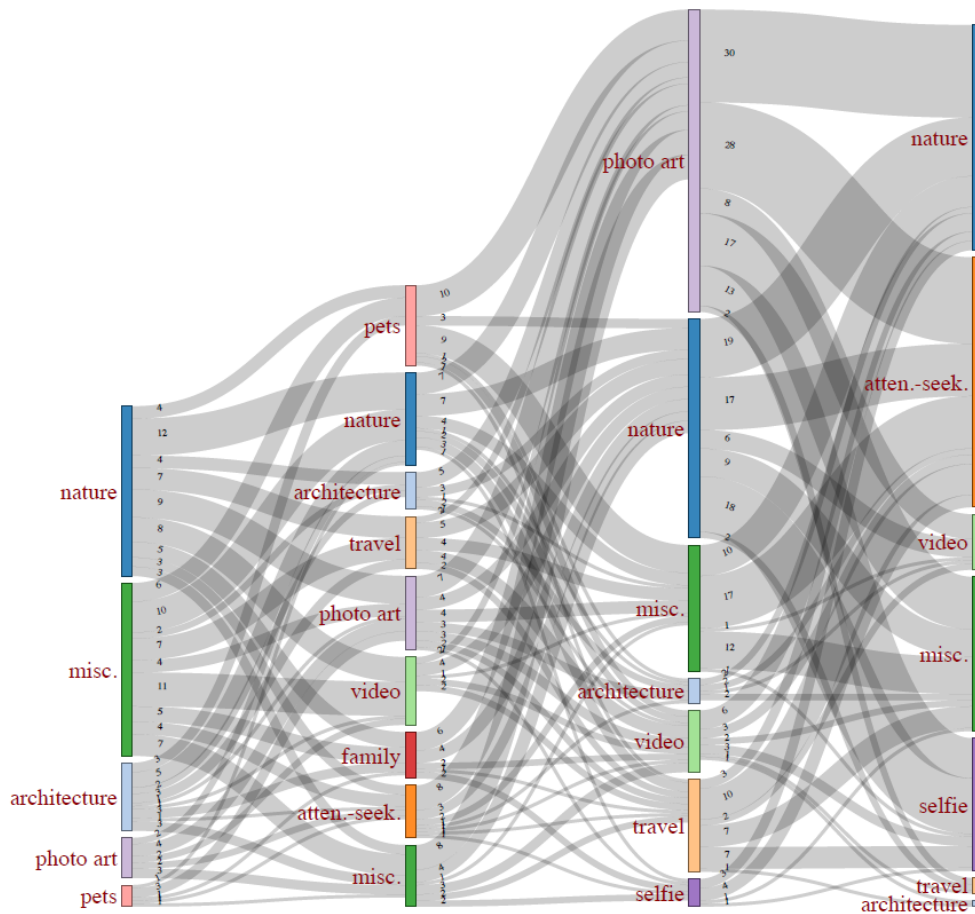

- **Top-25% ranked lurkers** transitions from one *topic-set* to another during the quarters of year 2013

- Lurkers tend to show patterns of topical interests that **do not significantly differ** from the ones of all users

- **Newcomers behavior:** higher flow in the outgoing transitions

A. Tagarelli, R. Interdonato (2013)
Ranking vicarious learners in research collaboration networks.
In *Proc. ICADL'13*

APPLICATIONS TO OTHER DOMAINS

Vicariously learning in collaboration networks

"Lurking" scenarios in information networks

- **Leeching** (a.k.a. free loading)
  - Greedy (or even illegal) use of computer resources
  - Examples:
    - Downloading in P2P networks
    - Direct linking
    - Wi-Fi leeching

- **Vicariously learning**
  - Occurs in *observational learning* contexts:
    - learning through being given access to the learning experiences of others

  - Focus: (research) collaboration networks
Research collaboration networks (1/2)

- Formed on top of digital libraries
- Common assumption:
  - two researchers are regarded as connected to each other if they have co-authored a paper

- Typical tasks:
  - expert finding
  - community discovery
  - relation prediction
Research collaboration networks (2/2)

- Mining hidden **expert-apprentice** or **advisor-advisee** relationships to understand:
  - Research community formation in a particular institutional context
  - Evolution of research themes over time
  - Predicting influence of a research study on a community
  - How to foster several experts on specific topics

- Current trend: expert-oriented investigation of co-authorships
- However, many members in a RCN are more likely to be **apprentice**:
  - in the initial stage of a researcher lifetime (early career)
  - w.r.t. all topics that at a particular time do not represent a researcher's main research interests

Vicariously learning

- Learning through being given access to the learning experiences of others
- In a publication context:
  - **people who marginally contribute to the research activity?**

- Vicariously-learning-oriented RCN:
  - Directed weighted graph model
    - Basic model for edge orientation: comparison of relative amount of publications

➤ **pubs(author#1) > pubs(author#2)**
➤ **pubs(author#1) > pubs(author#3)**
➤ **pubs(author#3) > pubs(author#2)**

Vicariously learning oriented RCN

- Interactions among authors expressed through edge weights based on:
  - **number of co-authorships**
    - to express the strength of collaboration
  - **number of *advisees* for each *advisor***
    - an advisor tends to divide her attention over all incoming stimuli that come from her advisees

$$w_t(i,j) = coPubs(i,j,t)\left(1 - \frac{\sum_{k \in advisees(i,t) \setminus \{j\}} coPubs(i,k,t)}{\sum_{k \in advisees(i,t)} coPubs(i,k,t)}\right)$$

coPubs(i,j,t): number of papers coauthored by authors *i* and *j* at time *t*

advisees(i,t): number of advisees (i.e., out-neighbors) of author *i* at time *t*

Vicarious learner ranking (1/2)

- **VLRank** algorithm:
  - Adaptation of LurkerRank such that
    - The lurking-oriented graph model is replaced with the VL-oriented weighted graph model
    - Advisees act as lurkers w.r.t. advisors (i.e., active users)

- Evaluation on the DBLP dataset
  - Static analysis
    - Full dataset (about 1.2M nodes, 4.7 links)
  - Evolution of vicarious learners
    - 3-year snapshots

time interval	# nodes	# links	avg in-degree	avg path length	# source nodes # sink nodes	avg in/out-degree *	clustering coefficient
-2013	1,191,619	4,712,489	3.95	7.50	54,647; 533,101	1.75	0.18
2004-2006	341,282	957,922	2.81	7.61	32,511; 139,016	1.33	0.44
2007-2009	469,345	1,412,556	3.01	7.16	40,021; 188,166	1.41	0.32
2010-2013	582,206	1,926,184	3.31	6.82	45,916; 227,990	1.50	0.28

Vicarious learner ranking (2/2)

- Issue: lack of ground-truth
- **ArnetMiner** based ranking
  - Expert's activity score: used to rank the researchers based on the cumulated weighted impact factor of one's papers published in the last years

$$r_i^* = \frac{1 + \sum_{j \in H^+(i)} AS(j)}{1 + \sum_{j \in H^-(i)} AS(j)}$$

  - $H^+(i)$ is the set of authors with h-index greater than i
  - $H^-(i)$ is the set of authors with h-index lower than i
  - $AS(j)$ is the activity score of author j provided by ArnetMiner

Quantitative analysis: Kendall correlation

	-2013	2004-06	2007-09	2010-13
VLRank vs. InOut	.153	.249	.259	.256
VLRank vs. DDRank	.284	.283	.295	.298
PageRank vs. InOut	-.097	.182	.177	.177
PageRank vs. DDRank	.133	.246	.246	.255
VLRank vs. AMRank	.115	–	–	.148
PageRank vs. AMRank	.043	–	–	.083
VLRank vs. PageRank	.422	.424	.410	.407

VLRank always obtains positive Kendall scores

VLRank always achieved higher correlation with InOut, DDRank and AMRank than PageRank, with gains up to 21.7% for InOut, 11.8% for DDRank, and 6.5% for AMRank.

Quantitative analysis: Bpref

	-2013			2004-06			2007-09			2010-13		
	$p=10$	$p=25$	$p=50$	$p=10$	$p=25$	$p=50$	$p=10$	$p=25$	$p=50$	$p=10$	$p=25$	$p=50$
VLRank vs. InOut	.336	.584	.664	.362	.561	.702	.409	.583	.713	.415	.580	.714
VLRank vs. DDRank	.687	.784	.744	.605	.701	.706	.644	.726	.717	.667	.730	.720
PageRank vs. InOut	.099	.328	.467	.204	.449	.666	.211	.460	.670	.219	.469	.676
PageRank vs. DDRank	.481	.626	.592	.528	.639	.648	.544	.658	.654	.580	.671	.668
VLRank vs. AMRank	.191	.448	.645	–	–	–	–	–	–	.264	.508	.663
PageRank vs. AMRank	.131	.338	.573	–	–	–	–	–	–	.166	.385	.603
VLRank vs. PageRank	.804	.853	.857	.620	.726	.815	.656	.754	.834	.650	.735	.817

> VLRank always outperforms PageRank also in terms of Bpref

> Bpref scores generally increase with the p% of relevant candidates

Qualitative analysis

- Comparison between the top-100 ranked lists produced by VLRank and PageRank on the whole DBLP network (-2013)

- VLRank detected and assigned highest scores to authors whose status can be tagged as vicarious learner with a certain objectivity
  - e.g., short career always within a research team, long career but with many co-authors, etc.

- Several authors in the PageRank top-ranked list should be considered as team leaders, or at least active contributors
  - e.g., many publications with few co-authors

A. Tagarelli, R. Interdonato (2014)
Lurking in Social Networks: Topology-based Analysis and Ranking Methods.
Soc. Netw. Analys. Mining (SNAM)

APPLICATIONS TO OTHER DOMAINS

Lurking in Social Trust contexts

Social trust and lurking (1/2)

- Measuring trust behaviors has long been an important topic in psychology and social science
- Computer science perspective: trust based on **active behaviors** shown by the users in an online community

Trustworthy users:
influential users, verified profiles

Untrustworthy users:
spammers, trolls, fake profiles

What about lurkers?

Social trust and lurking (2/2)

- (Active) users tend to avoid wasting their time with people who show null or slow responsiveness – like lurkers do

> **Should lurkers be treated as *untrustworthy* users?**

- Preliminary insight into understanding relations between lurkers and trustworthy/untrustworthy users:
  - Comparison between LurkerRank and *TrustRank* [Gyongyi, et al., 2004]

> **Goal: To improve the trustworthiness of the lurkers to be detected**

Gyongyi, Z., Garcia-Molina, H., Pedersen, J. O. (2004) Combating Web Spam with TrustRank. In *Proc. VLDB*.

TrustRank-biased LurkerRank (1/2)

- Definition of **TrustRank-biased LurkerRank** methods
- TrustRank in a nutshell
  - A biased PageRank in which the teleportation set corresponds to the "good part" of an a priori selected *seed set*
  - The seed set is a relatively small subset of nodes in the graph, each of which is labeled as either trustworthy or untrustworthy by some *oracle* function

- **Issue in OSNs**: inferring trust from user interactions
  - Number of received likes, favorites, or comments as implicit trust statements

- Assumption: the higher the number of users that indicate trust in a user, the more likely is the trustworthiness of that user
- **Trust-Entropy-based oracle** function: $H(i) = -\dfrac{1}{\log |V_i|} \sum_{j \in V_i} p_j \log p_j \qquad p_j = \dfrac{ET(j,i)}{\sum_{k \in V_i} ET(k,i)}$

TrustRank-biased LurkerRank (2/2)

- A user i is regarded as "good" if the corresponding $H(i)$ belongs to the 3rd quartile of the distribution of H values over all users
- Note that: if user i likes a post by j, then
  - edge $j \to i$ is created in the LurkerRank graph
  - edge $i \to j$ is created in the TrustRank graph

- All LurkerRank methods show positive correlation with TrustRank
- Higher correlation when using TrustRank-biased LR
- TrustRank-biased LR have still strong correlation with their respective LR methods

flickr	LR vs. TrustRank	trust-LR vs. TrustRank	trust-LR vs. LR
LRin	.393	.436	.639
LRout	**.562**	.556	**.980**
LRin-out	.441	.640	.688
ac-LRin	.445	.434	.728
ac-LRout	.561	.559	.945
ac-LRin-out	.402	**.724**	.498

Kendall correlation

Trust-oriented bias in LurkerRank would not significantly decrease lurker ranking effectiveness while also accounting for the user trustworthiness

CONCLUSION AND FUTURE WORK

What we have done …

Investigated a *previously unexplored problem in SNAM*

Topology-driven definition of lurking

In-, Out-, and InOut-neighbors driven ranking methods

- and formulations based on PageRank and alpha-centrality

Evaluation on Twitter, FriendFeed, Flickr, Google+, and Instagram

- Reciprocity, preferential attachment
- Delurking-oriented randomization model
- Percolation/resilience analysis

Lurking over time

- Lurkers vs. inactive users
- Lurkers vs. newcomers
- Responsiveness
- Preferential attachment
- Temporal trends and clustering
- Topical evolution

Lurking in other domains

- Lurking and Social Trust
- Vicarious Learner ranking in collaboration networks

…and what we would like to do

- Extensions of the lurking concept
  - Content-biased lurking
  - Boundary-spanning lurking
- Integration with
  - Influence maximization algorithms
  - Community detection algorithms
  - Trust/Distrust ranking algorithms

  - *… any other idea is welcomed!*
